

1. Ariane 64 to the GTO-class staging orbit: the cargo and a passive xenon propellant module, one launch per trip
2. Capture the cargo and module as one stack; transfer the xenon (up to 21 days); release the empty module
3. Outbound spiral with 25 kW of electric propulsion, 1.46 N: 2.64 km/s, about 315 days with 5 t of cargo
4. Approach after clearance, dock and hand over the cargo in NRHO
5. Collect up to 0.5 t of return cargo (optional)
6. Return spiral, about 173 days with the lighter tug
7. Hand over the return cargo, refuel 2.54 t of xenon and repeat: 9 round trips of 1.5 years in 15 years
